2. Controls

## Layout.

**VaCAII** features 3 passive VCAs/LPGs in a single module. Each LPG has two different settings. VaCAII can be used to process audio or CV signals.

6HP

No current draw.

## Controls.

### 1. CONTROL VOLTAGE INPUTS.

Connect your CV sources here. If CV inputs **B** and **C** are disconnected they will be normalised to the signal at **CV IN A**.

### 2. VCA/LPG A CONTROLS.

These controls determine the nature of VCA/LPG **A**. The **LEVEL** potentiometer sets the strength of the CV signal for **CV IN A** (1).

The switch sets the mode for that channel. If the switch is in the MIDDLE position channel **A** will act as a passive VCA. If it is in the UP or DOWN position it will act as one of two different LPGs with slightly different cutoff points.

### 3. VCA/LPG B CONTROLS.

As above but for channel **B**.

### 4. VCA/LPG C CONTROLS

VCA/LPG **C** operates in the same way as A and B when the switch below it is set to '**LEVEL IN C**'. If this switch is set to '**MIX A|B**' then that channel will use a mix of the signals at **CV IN A** and **B** instead. The bias of these signals is set by the potentiometer.

### 5. INPUTS A-C.

Connect the signals you wish to be affected by the VCAs/LPGs here. These can be audio or CV.

### 6. OUTPUTS A-C.

Use these outputs to route the affected signals to different parts of your system.
